Work Sample:

Centralized Doc-as-Code Documentation Portal Implementation

Overview

To address critical gaps in documentation accessibility, consistency, and maintainability, I designed and implemented a centralized Doc-as-Code documentation portal.

Stakeholders were struggling to efficiently access documentation because content was scattered across multiple platforms, with no single source of truth. This resulted in fragmented information, difficulty in locating relevant content, and increased reliance on outdated or inconsistent materials.

The existing documentation ecosystem also lacked essential capabilities required for modern documentation practices. Cross-referencing was manual and error-prone; broken links were not automatically detected; and versioning support was limited, making it difficult to manage product updates effectively. Additionally, authoring and publishing workflows were complex and maintenance-heavy.

To address these challenges, I built a centralized documentation portal using a Doc-as-Code approach that enables structured authoring, version control, automated validation, and streamlined publishing. This transformed documentation into a single source of truth improving accessibility, consistency, and scalability while aligning with modern development workflows.

The Solution

- Implemented a centralized **Doc-as-Code documentation portal** using **Docusaurus (React-based)**
- Enabled **Markdown-based structured authoring** for faster and scalable content creation
- Integrated **GitHub for version control, collaboration,** and **traceability**
- Developed **reusable templates** and **components** to ensure consistent documentation standards

Tech Stack

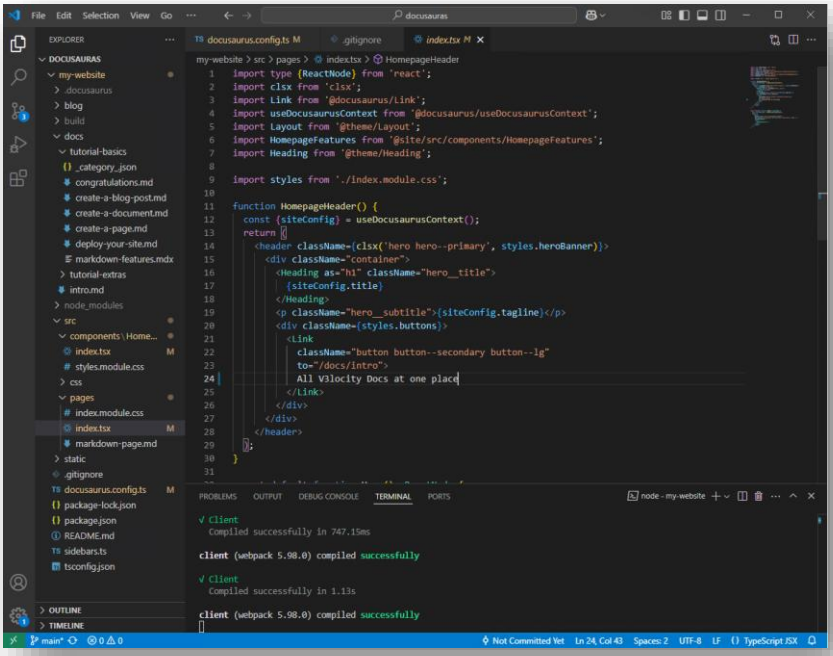
Docusaurus
(React framework)

Markdown
(Content authoring)

GitHub
(Version control & Collaboration)

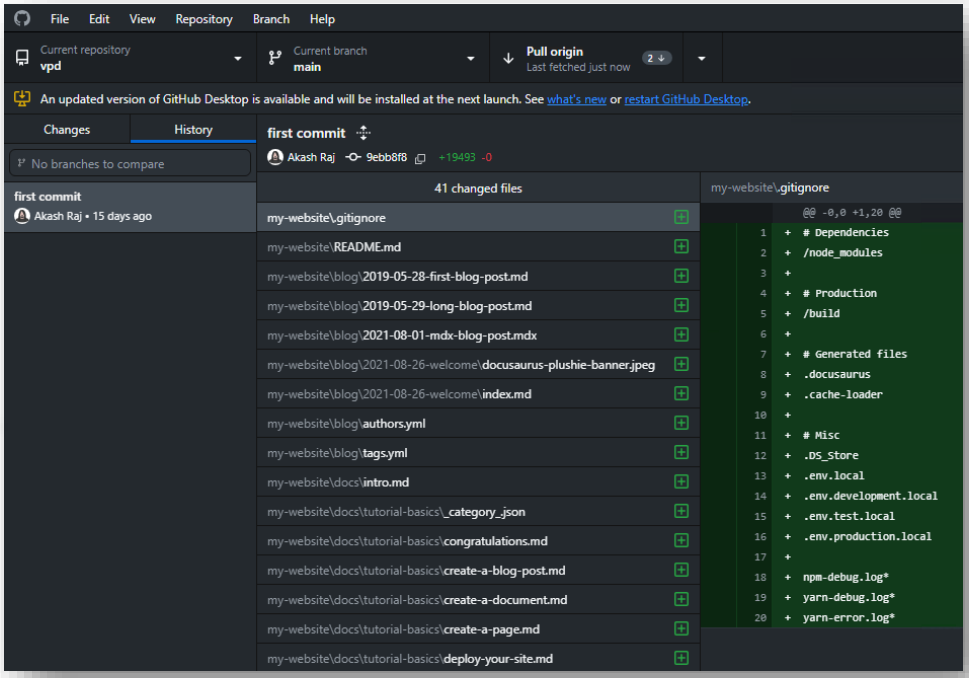
CSS / Custom Components
(UI customization)

Solution

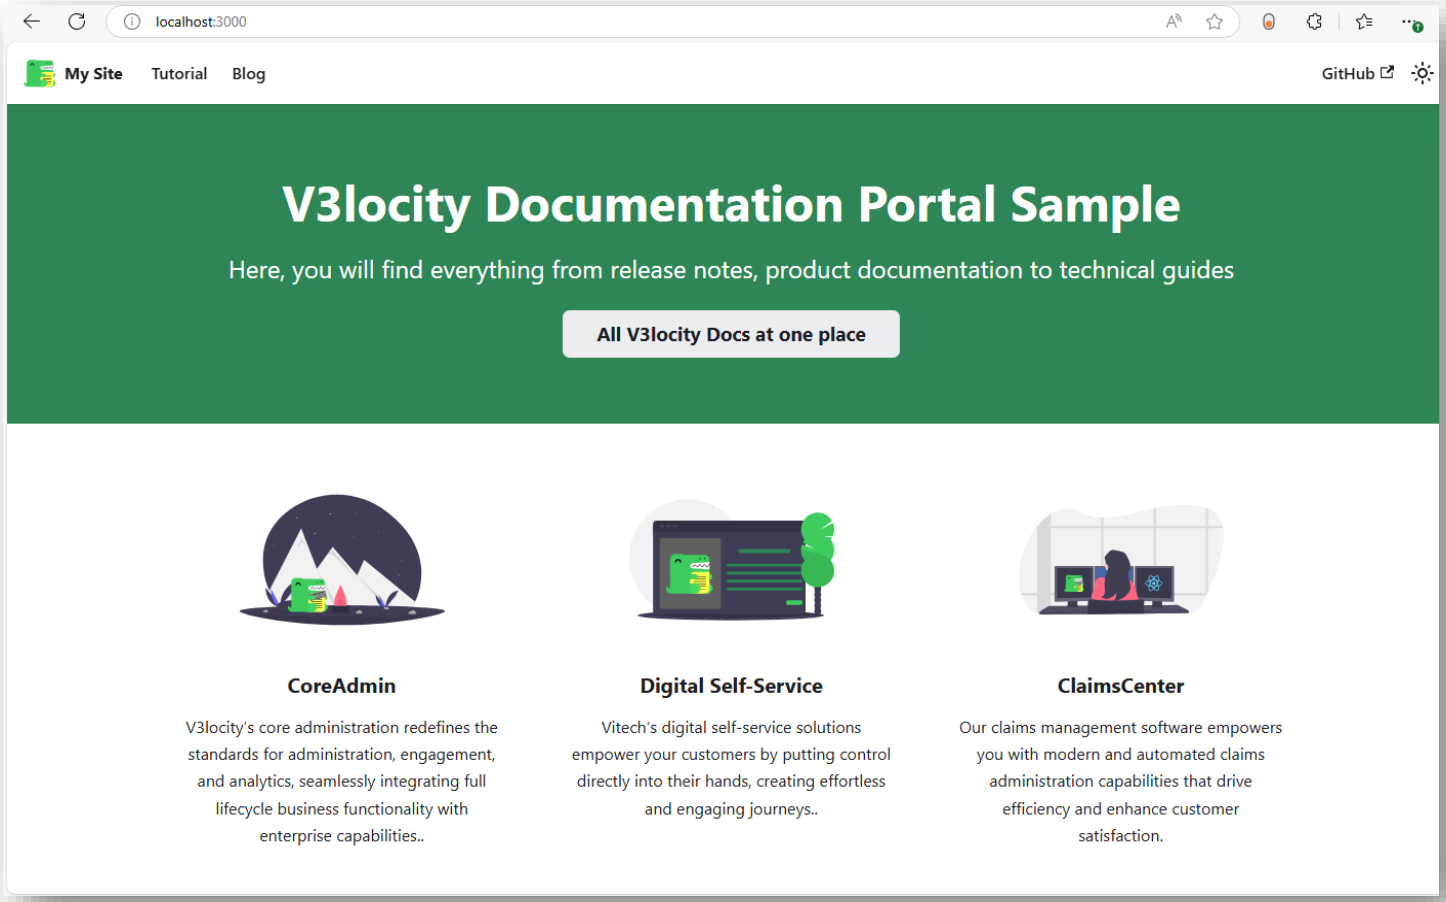


Markdown content in VS Code

GitHub repo that stores all the configs and content



Output



Benefits

- **Single Source of Truth**: Centralized portal eliminated fragmented and outdated content
- **Improved Accessibility**: Faster, easier discovery of documentation through structured navigation
- **Consistency at Scale**: Standardized templates ensured uniform quality across all deliverables
- **Reduced Effort**: Streamlined authoring and publishing, lowering manual overhead
- **Better Reliability**: Improved cross-referencing and reduced broken links
- **Efficient Versioning**: Simplified tracking and management of product updates
- **Enhanced Collaboration**: Enabled Git-based reviews and transparent workflows
- **Scalable Framework**: Future-ready architecture supporting product growth

My Role

- Designed and implemented the **end-to-end Doc-as-Code strategy**
- Built and customized the **Docusaurus documentation portal**
- Defined **documentation structure, templates, and standards**
- Integrated **version control and collaboration workflows using GitHub**
